Proposed Research Title:

WEB-TRANSCO: A Web-Based Booking Platform for Jeepney Transport Services

Problem/Opportunity:

Jeepney transport groups face inefficiencies in managing bookings for cargo, shuttle services, and private rides. Customers often rely on manual arrangements, which cause delays, miscommunication, and missed opportunities. A digital solution can streamline these processes and make services more accessible.

Proposed Technology:

A centralized web-based booking platform that allows customers to reserve jeepneys for private rides, cargo transport, and shuttle services, with real-time scheduling and payment options.

Rationale/Significance:

This research is relevant because it modernizes traditional jeepney operations, making them more organized and customer-friendly. It is feasible with current web and mobile technologies, and valuable as it improves efficiency, reduces costs, and enhances customer satisfaction. For stakeholders, WEB-TRANSCO creates new revenue streams, strengthens competitiveness, and promotes sustainable transport solutions while expanding services beyond passenger trips.
