COURSE REFLECTION

Student: Josh Marcus L. Amahan

Through IS113 I learned that digital innovation is not only about choosing a new tool. It starts with a clear organizational problem, continues with careful evaluation of technologies, and ends with a strategy that the organization can adopt and sustain.

Working with emerging technologies showed the need to balance opportunity and risk. New platforms and systems can improve efficiency or customer experience, but they must fit the organization's capacity, data practices, and users. The Technology Evaluation Matrix and strategy work made this concrete: criteria, evidence, and trade-offs matter more than trends alone.

The research process—from literature review and conceptual framework to the final paper—taught me to ground recommendations in existing knowledge and a logical structure. Writing and revising the manuscript improved how I organize arguments, cite sources, and connect analysis to practical implications for FlowBikes.

Ethical technology adoption became a recurring theme: privacy, fairness, transparency, and responsible use of data and AI. Considering adoption barriers and stakeholder impact helped me see that a technically strong solution can still fail if people, process, and ethics are ignored.

Professional communication was essential throughout—clear problem statements, matrices, strategy documents, and the executive presentation. I learned to present complex ideas so that both technical and non-technical audiences can follow the reasoning and the recommendation.

Overall, the course connected individual skills (problem analysis, Coursera concepts) with group work on FlowBikes. I leave with a clearer sense of how to research, evaluate, and communicate a digital innovation proposal in a responsible and professional way.
