# COURSERA APPLICATION BRIEF

Student: Josh Marcus L. Amahan

The assigned Coursera learning activities strengthened the foundation of our IS113 work on FlowBikes, even though my Week 4 Organizational Problem Analysis was an individual output and not originally written about FlowBikes.

From that individual analysis I practiced defining a real organizational problem, identifying stakeholders, and framing constraints and opportunities. Those same skills transferred directly to FlowBikes: clarifying the business problem, mapping pain points in operations or customer experience, and stating why a digital innovation is needed rather than only describing a technology.

The Coursera material on digital transformation, emerging technologies, and responsible technology use helped in later stages of the FlowBikes project. Concepts on evaluating technology fit, risks, and value supported our Technology Evaluation Matrix and the choice of solutions that are practical for the organization. Ideas on data, platforms, and innovation strategy informed the Digital Innovation Strategy Analysis and the final research paper. Emphasis on ethics, adoption barriers, and professional communication aligned with our literature review, conceptual framework, and presentation of recommendations.

In short, Coursera reinforced a structured way of moving from problem → technology options → strategy → evidence-based recommendation. That process applied to FlowBikes even when some earlier individual work (such as Week 4) was not about the same organization. The transferable methods—problem framing, systematic evaluation, ethical consideration, and clear communication—were the bridge between the personal output and the group's digital innovation proposal for FlowBikes
